**TripleGrind** Brush

**RIEGER**

The **TripleGrind Brush** is a world first in peripheral grinding. Thanks to the innovative tool concept, the **TripleGrind Brush** enables peripheral grinding and edge rounding in one clamping.

The grinding layer can be selected according to the given requirements of the grinding operation. With two different tool concepts, an exchangeable brush for edge rounding can be attached on the front or on the circumference, depending on the application.

You can also choose from a variety of trimmings for the brush. If you need a different brush for an application, it can also be changed on the machine. With these possible combinations, the right tool can be designed for your grinding and brushing operation.

We would be happy to advise you further.
